P1808 Pilot Operated Relief Valve/ Back Pressure Regulator

The P1808 pilot-operated relief valve/back pressure regulator is used to maintain pressure on gas separators, and in pressure relief applications in gas distribution systems. The function of the P1808 is controlled by the type of pilot installed on the unit. This allows the unit to achieve wide-open f low more easily. The unit controls pressures from 3 to 125 PSIG (0.21 to 8.6 Bar), and the set pressure can be adjusted for individual requirements by the adjusting screw on the pilot.

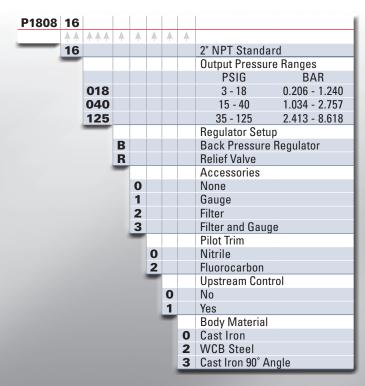

Applications

- Gas Service
- Gas Separators
- Distribution Relief Device

Features

- Pilot Operated
- High Flow Capacity

- Shaded areas indicate capacities with main valve wide-open.

1. Capacities based on 0 PSIG (0 BAR) outlet pressure. If outlet pressure is not 0 PSIG (0 BAR), shaded capacities may be recalculated using the wide-open C₀ and the desired pressure drop.

^{1.} Set pressure is defined as the pressure at which the pilot exhaust starts to bubble (discharge).

^{2.} Crack pressure is the inlet pressure at which the main valve starts audible flow.
3. Inlet pressure buildup over the set pressure to achieve wide-open capacity.
4. Capacities with inlet piping equal to body size and without outlet piping.
